Hello sandymac,

Are you the author of this: <https://mcpmarket.com/server/myanonamouse>

Babywhale

Message by sandymac added 2026-08-25 02:49:43.343616

sort of, I have never seen mcpmarket until now. My code is at <https://github.com/sandymac/myanonamouse-mcp>

Hello sandymac,

I should warn you that this might cause potential problems for members using it. Under rule 1.7, we only allow automation via the official API.

We've recently had a member getting automatically disabled because they used the code offered in the mcp market at <https://mcpmarket.com/server/myanonamouse>. I'm assuming it's not a problem with MCP itself, rather the AI goes rogue and starts using options outside the API as dictated by the rules.

For the time being, I've removed your MCP forum post.

Is it possible to make the code no longer public?

Have a nice day,

Babywhale

Message by sandymac added 2026-08-26 00:18:02.392498

It's my belief the MCP server only uses the API published but looking at the API pages just now they are different than when I first coded this MCP server months ago. I'll revisit that part of the project and try to tease out if details changed but the list at the end I just extracted from the project are all URLs that are listed under the current API. It's not possible for my code to access other parts of MAM.

Also, it can ONLY connect to MAM after you've configured it with a generated API session cookie from <https://www.myanonamouse.net/preferences/index.php?view=security> Logically this could ONLY be the official API. TBH I've not done an adversarial security analysis of this code or myanonamouse.net as it's my desire to keep my account in good standing. (I'm open to participating in such a review.)

This MCP code is effectively the same that a desktop AI agent (Claude code) could do with curl and jq (a JSON query tool to optimize/filter responses) except some scaffolding to provide OAuth authentication so it can be secured on the public internet that mobile clients can make use of it and it does have special logic to communicate 429 rate limit errors as Claude AI will blast 10 or 20 API calls in rapid fire succession.

Either the offending user was supplementing their MAM access with other tools or not respecting 429 errors.

I am able to make my GitHub project private but that is like asking Porsche not to sell cars because their otherwise street legal vehicles can exceed the speed limit ... and there remaining many other vehicles capable of speeding.

I'm happy message with MAM site admins or other users and understand what they are trying to achieve or improve how my code uses the API. The discussion you deleted was the entirety of the external feedback I have received until you messaged.

I use my MCP connector almost weekly with Claude mobile app and find it tremendously helpful. My use case was generally described in the deleted discussion.

These are the only URLs the MCP is capable of accessing and the internal MCP tool calls that trigger them:

https://www.myanonamouse.net/tor/js/loadSearchJSONbasic.php	POST	search_audiobooks, search_ebooks, search_music, search_radio, search_torrents, get_torrent_details, get_top_10
https://www.myanonamouse.net/jsonLoad.php	GET	get_user_data
https://www.myanonamouse.net/json/userBonusHistory.php	GET	get_user_bonus_history
https://www.myanonamouse.net/json/dynamicSeedbox.php	GET	update_seedbox_ip
https://www.myanonamouse.net/json/jsonIp.php	GET	get_ip_info, --test-connection

Message by sandymac added 2026-08-26 04:16:48.820585
I've added a 200 ms delay between requests between the MCP server and the MAM API endpoints.

Message by Babywhale added 2026-08-26 17:27:26.572458
Hello sandymac,

Thank you for laying out your code base and thinking.

I would still ask that you make the code non-public if you can, at your discretion. The problem is that ignorant members with no coding experience will quickly ask for whichever AI agent to expand upon the code and go about fetching/scraping account data via a headless login, leading to them being disabled from MAM.

I appreciate your work trying to help mam users, but as it's being misused by ignorant members, the forum post will remain non-public for now.
